Adding the Attendance Tool to Secure Meter

Step-by-step guide for the Secure Meter project | October 31, 2026

What you need

Before you start, check that you have these:

- The Secure Meter project folder (`secure-meter`), unzipped on your computer.
- Your three attendance files: one `.html` file, one `.css` file and one `.js` file.
- A text editor such as Notepad or VS Code.

The work has two parts. First you put your three files in a new folder inside the project. Then you add one entry to a list file, so the main page knows the tool exists.

Project file paths

Every path in this guide starts from the project folder `secure-meter`. These are the paths you will use:

What	Path inside the project
Project folder	`secure-meter/`
Main page (open this in the browser)	`secure-meter/index.html`
Tool list (you edit this)	`secure-meter/assets/js/tools.js`
Folder for the new tool	`secure-meter/tools/attendance/`
Tool page	`secure-meter/tools/attendance/index.html`
Tool styles	`secure-meter/tools/attendance/style.css`
Tool logic	`secure-meter/tools/attendance/app.js`
Shared libraries	`secure-meter/vendor/`

Write the full location of the project on your computer here, so you can find it later. Example: `D:\Work\secure-meter`.

My project folder: (type the full path here)

In `tools.js` the path is written without the project name, starting from `tools/`, for example `tools/attendance/index.html`. It is relative to the main `index.html`.

Step 1: Create the tool folder

1. Open the `secure-meter` folder.
2. Open the `tools` folder inside it.
3. Create a new folder and name it exactly `attendance` (small letters, no spaces).

The path is now `secure-meter/tools/attendance/`.

Step 2: Copy your three files into it

Copy your three files into `tools/attendance/` and rename them like this:

Your file	Rename it to
The `.html` file	`index.html`
The `.css` file	`style.css`
The `.js` file	`app.js`

The HTML file must be called `index.html`. This is the page the main project opens.

Your folder should look like this:

```
secure-meter/
├── index.html
├── assets/
│   └── js/
│       └── tools.js
├── tools/
│   ├── meter-search/
│   ├── non-amr-bis/
│   ├── case-study/
│   ├── agdt-letters/
│   ├── agdt-1983/
│   └── attendance/
│       ├── index.html
│       ├── style.css
│       └── app.js
└── vendor/
```

Step 3: Check the file links inside index.html

Open `tools/attendance/index.html` and look for the two lines that load your CSS and JavaScript. They must use the names from Step 2:

```
<link rel="stylesheet" href="style.css">
...
<script src="app.js"></script>
```

If your old files had different names, change these two lines to the new names. If the `<script>` line is inside `<head>`, move it to just before `</body>`. Otherwise the page may run before its buttons exist.

If your tool uses a library, add a line for it. The libraries already in the project are in the `vendor` folder, and from your tool folder the path goes up two levels:

```
<script src="../../vendor/jszip.min.js"></script>
```

Put library lines before `app.js`.

Step 4: Register the tool in tools.js

This is the step that makes the tool appear in the sidebar and on the Home page.

1. Open `secure-meter/assets/js/tools.js` in your text editor. This file is already in the project.
2. You will see the five existing tools, and the file ends with `];`.
3. Paste the block below just before that `];`.

```
{
  id: "attendance",
  name: "Attendance Record",
  short: "Attendance",
  path: "tools/attendance/index.html",
  description: "Mark daily attendance and export a record.",
  worksWith: "Employee list",
  button: "Open Attendance"
},
```

This block is not downloaded from anywhere. You copy it from this guide and change the values if you want. The easiest way to get the format right is to copy one of the existing entries in `tools.js`, paste it below itself and change the seven values.

What each line means:

Line	What to put	Example
`id`	A short name with no spaces. It shows in the page address.	`"attendance"`
`name`	The title in the sidebar and on Home.	`"Attendance Record"`
`short`	A shorter version of the name.	`"Attendance"`
`path`	The tool's `index.html`. It must match the real folder.	`"tools/attendance/index.html"`
`description`	One sentence shown on the Home card.	`"Mark daily attendance and export a record."`
`worksWith`	The kind of file the tool uses.	`"Employee list"`
`button`	The text on the Open button.	`"Open Attendance"`

Keep these points in mind:

- Every entry ends with `},`. Do not delete a comma.

- Keep the `];` at the very end of the file.
- Save the file after pasting.

Step 5: Test it in the browser

1. Double-click the main `secure-meter/index.html`.
2. Press Ctrl+F5 to reload without the old cached files.
3. Look for **Attendance Record** in the sidebar and on the Home page.
4. Open it and try the main actions: add a record, save, export.
5. Refresh the page and confirm that your data behaves as you expect.

If something does not work

Press F12 in the browser and open the Console tab. It shows the exact error.

What you see	Likely cause	Fix
Attendance is missing from the sidebar	A missing comma or bracket in `tools.js`	Check the entry you pasted and the `];` at the end
A blank page when you open the tool	The `path` in `tools.js` does not match the folder, or the file is not named `index.html`	Check the folder name and file name
No styling	The `style.css` link in `index.html` is wrong	Check the file name in the `<link>` line
Buttons do nothing	The `app.js` link is wrong, or the script loads before the page	Check the `<script>` line and move it before `</body>`
Console says something is "not defined"	A library or helper file is not loaded, or loads too late	Add its `<script>` line before `app.js`
Error mentioning `import`	The JavaScript uses modules, which do not work when opened by double-click	Replace `import` with normal `<script>` lines
Fonts or libraries missing	The tool loads them from the internet	Check your connection, or save the file locally

Final checklist

- The folder `tools/attendance/` exists.
- It contains `index.html`, `style.css` and `app.js`.
- The links inside `index.html` match those file names.
- `tools.js` has the new entry, with commas and `];` intact.
- You reloaded with Ctrl+F5.
- Attendance Record appears in the sidebar and opens correctly.

If you would like help, send your three attendance files and I can check them and add them to the project for you.
